Unit Test Report Document

Docente:

Prof. Andrea De Lucia

Studenti:

Giovanni Forlenza

Introduzione

Il test di unità è una fase di testing che mira a verificare la correttezza e il funzionamento isolato di singole unità di codice, come funzioni, classi o metodi, all'interno di un programma. Per lo sviluppo dei test sono stati utilizzati due framework JUnit e Mockito.

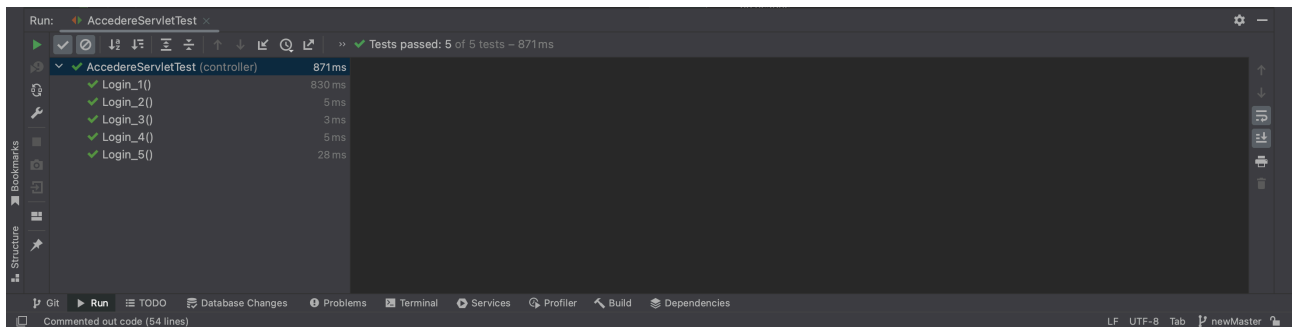

JUnit è un framework di testing unitario per Java, permette di definire ed eseguire test per le singole unità di codice, come metodi o classi, in modo da verificare se si comportano come previsto.

Mockito è un framework di mocking per Java che aiuta a creare mock (o oggetti simulati) delle dipendenze esterne delle unità di codice durante i test di unità. Mockito consente di creare oggetti simulati che sostituiscono dipendenze esterne, permettendoti di controllare il comportamento di queste dipendenze e concentrarti sul test della singola unità in isolamento. Con Mockito, puoi definire il comportamento di questi mock e verificarne l'interazione con il codice sottoposto a test.
